

## Specialized Optum TERM Panel Evaluations

The following chart summarizes minimum standards for specialized CWS and Juvenile Probation evaluations (to be used in conjunction with Optum TERM Evaluation Guidelines):

<b>Juvenile Firesetting Risk Assessment (Juvenile Probation)</b>
<b>Methods of Evaluation</b>
<p>The assessment should be based on the integration and synthesis of multiple sources of information, including:</p> <ul style="list-style-type: none"> <li>● Empirically guided comprehensive clinical interview, to include details of firesetting history, frequency of incidents, method, motive, consequences, family and environmental factors, and review of known associated risk factors. An independent history of the minor’s firesetting behaviors should also be obtained from collateral sources.               <ul style="list-style-type: none"> <li>○ Examples of published structured interviews include the Juvenile Firesetter Child and Family Risk Surveys, Firesetting Risk Interview and the Child Firesetting Interview, as well as, the Comprehensive Fire Risk Evaluation</li> <li>○ The highest degree of accuracy is achieved with these measures if both the juvenile interview schedule and interview with at least one caregiver are conducted</li> </ul> </li> <li>● Behavioral observations and formal mental status exam</li> <li>● Collateral interviews and review of all available collateral data, including fire or police incident report(s)</li> <li>● Use of empirically guided inventories or tools for assessment of fire setting behavior as applicable</li> <li>● Other standardized assessment measures with demonstrated reliability and validity to assess cognitive functioning, achievement abilities, personality and psychopathology, social, emotional and behavioral functioning, history of trauma and its impact on the client, as well as other domains of functioning as specified by referral questions</li> <li>● The impact of self-presentation on the validity of psychological tools should be recognized and assessed</li> </ul> <p>Estimation of risk level, community safety, and identification of treatment needs should be the immediate focus. The evaluation should be guided by available best practice guidelines. Any psychological tests utilized should be relevant to understanding risk, empirically supported, and appropriate to the minor’s age, clinical status, and ethnicity. Use of unstructured clinical judgment with regard to risk estimation will NOT meet quality review standards.</p>

**Adult Psychosexual Risk Evaluation (CWS\*) and Juvenile Sexual Behavior Problem Risk Assessment  
(Juvenile Probation)**

\*For CWS evaluations, the provider must be approved by  
the California Sex Offender Management Board

**Methods of Evaluation**

The assessment should be based on the integration and synthesis of multiple sources of information, including:

- Empirically guided comprehensive clinical interview, to include psychosexual history and review of: past trauma history, deviance and paraphilias, sexual and non-sexual offense history, known associated dynamic and historical risk factors, situations or circumstances under which sexual behavior problems occur, current perceptions about offense, interpersonal relationships, motivation for treatment, and response to prior interventions
- Behavioral observations and formal mental status exam
- Collateral interviews and review of all available collateral data, including victim statements and arrest records for all offenses
- Psychological tools designed for the evaluation of sexual behavior problems as applicable (such as the Child Sexual Behavior Inventory-III for ages 2-12, or Child Sexual Behavior Checklist-2nd Revision for ages 12 years and younger) and other empirically guided risk assessment strategies as applicable if supported by current literature and appropriate to clinical circumstances
- Other standardized assessment measures with demonstrated reliability and validity to assess cognitive functioning, achievement abilities, personality and psychopathology (including psychopathy in adults), as well as other domains of functioning as specified by referral questions
- The impact of positive self-presentation on the validity of psychological tools should be recognized. Assessment of response style/bias is required for all evaluations

Risk appraisal, victim/community safety, and identification of treatment needs should be the immediate focus of the evaluation. Evaluations should be guided by available best practice guidelines. Any psychological tests utilized should be relevant to understanding risk, empirically supported, and appropriate to the client's age, clinical status, and ethnicity. Use of unstructured clinical judgment with regard to risk estimation will NOT meet quality review standards. NOTE: Caution should be taken when assessing children in this context; providers should guard against projecting adult constructs onto children.

<b>Juvenile Competency to Stand Trial</b> (Juvenile Probation)
<b>Methods of Evaluation</b>
<p>The assessment should be based on the integration and synthesis of multiple sources of information, including:</p> <ul style="list-style-type: none"> <li>● Empirically guided comprehensive clinical interview, to include review of significant features of the minor’s social, emotional, cognitive, and behavioral development, medical and mental health history, educational history, current developmental and clinical status, and family context</li> <li>● Behavioral observations and formal mental status examination as it relates to the demands of the specific legal case</li> <li>● Collateral interviews and review of all available collateral information</li> <li>● Assessment of functional abilities related to the legal standard of competence to stand trial (e.g. factual and rational understanding, competence to assist counsel). Selection of competency assessment tools should be based on appropriateness for the minor’s developmental and clinical status. Examples of competency assessment tools include:               <ul style="list-style-type: none"> <li>○ Structured competency interview schedule (e.g., Juvenile Adjudicative Competence Interview; Grisso, 2005).</li> <li>○ Standardized competency assessment instruments normed and validated for the juvenile population. <i>Note: Currently, all the available standardized competency assessment instruments are designed for use with adults and no juvenile norms have yet been published.</i></li> </ul> </li> <li>● Other standardized assessment measures with demonstrated reliability and validity to assess developmental maturity, cognitive functioning, personality and psychopathology, history of trauma and the impact on the client, social, emotional and behavioral functioning and other domains of functioning as indicated by referral questions and relevance to assessment of competence</li> <li>● The impact of self-presentation on the validity of psychological tools should be recognized and assessed</li> <li>● Evaluators should be familiar with local competence remediation services to inform their recommendations, and should consider any legally mandated time parameters for remediation</li> </ul> <p>Analysis of competency to stand trial and provision of a remediation opinion should be the immediate focus of the evaluation. The evaluation should be guided by available best practice guidelines. Any psychological tests or assessment tools utilized should be empirically supported, relevant to understanding competency, and appropriate to the minor’s age, clinical status, and ethnicity. Use of unstructured clinical judgment with regard to competency assessment will NOT meet quality review standards. Pursuant to California Welfare and Institutions Code 709, the evaluator must assess whether the minor suffers from a mental disorder, developmental disability, or developmental immaturity and whether the condition impairs the minor’s competency. A minor is incompetent to proceed if he or she lacks sufficient present ability to consult with counsel and assist in preparing his or her defense with a reasonable degree of rational understanding, or lacks a rational as well as factual understanding, of the nature of the charges or proceedings against him or her. <i>Note: Competency evaluations for juveniles should be made in light of juvenile rather than adult norms. Developmental immaturity should be discussed in terms of deviations from what is expected of children of the same age.</i></p>

<b>Neuropsychological Evaluation</b> (CWS, Juvenile Probation)
<b>Methods of Evaluation</b>
<p>The assessment should be based on the integration and synthesis of multiple sources of information, including:</p> <ul style="list-style-type: none"><li>• Empirically guided comprehensive clinical interview to include a complete neuropsychological history (e.g., presenting psychological and neuropsychological symptoms, developmental, medical and psychiatric history, medications, neurological tests)</li><li>• Behavioral observations and formal mental status exam</li><li>• Collateral interviews and review of all available collateral data</li><li>• Standardized neuropsychological measures with demonstrated reliability and validity to assess relevant domains of cognitive functioning (general intellect, higher level executive skills, attention and concentration, learning and memory, language, visual-spatial skills, motor and sensory skills)</li><li>• Other standardized assessment measures with demonstrated reliability and validity to assess emotional, behavioral and adaptive functioning as specified by referral questions</li><li>• The impact of self-presentation on the validity of psychological and neuropsychological tools should be recognized and assessed</li></ul> <p>Neuropsychological status as it relates to the case plan should be the immediate focus of the evaluation. The evaluation should be guided by available best practice guidelines and any (neuro) psychological tests utilized should be empirically supported and appropriate to the client's age, clinical status, and ethnicity. If client has been referred for a comprehensive evaluation, neuropsychological screening will NOT meet quality review standards.</p>

**Family Code 7827 Evaluations  
(CWS)**

**Methods of Evaluation**

The assessment should be based on the integration and synthesis of multiple sources of information, including:

- Empirically guided comprehensive clinical interview, to include review of significant historical information, such as family of origin, educational history, mental health and medical history, substance use history, marital history, work history, criminal history, current symptomatology, treatment history and parents' use of clinical intervention, sources of stress and support, interpersonal relationship history, history of parenting, parental acceptance of responsibility, capacity for empathy, and readiness to change
- Behavioral observations and formal mental status exam
- Collateral interviews and review of all available collateral data
- Standardized assessment measures with demonstrated reliability and validity to assess relevant aspects of parental functioning as specified by referral questions (cognitive functioning, parenting skills, personality and psychopathology, history of trauma and its impact on the client, emotional functioning, and adaptive functioning as appropriate)
- If symptoms of a particular Axis I or Axis II disorder are critical to case conceptualization, consideration should be given to use of focused measures of psychopathology as an adjunct to any broad based measures that have been administered (e.g., psychopathy, substance use disorders)
- The impact of positive self-presentation on the validity of psychological tools should be recognized. Assessment of response style/bias is required for all evaluations
- As most tests have not been adequately validated or normed for the child protection population, a conservative approach to interpretation of findings should be adopted (e.g., seeking corroboration across multiple information sources, clearly noting any limitations to the tests' use in the evaluation report)
- Prognosis for remediation within the legal time limits specified for the case must be included. Note: The date by which parent must demonstrate substantial progress in services is listed on CWS Form 04-178 and should be referenced when addressing prognosis. Any interventions proposed must be achievable within this timeframe

The immediate focus of the evaluation should be the determination of ability to safely parent the child(ren), capacity to benefit from services within legal time parameters, and identification of specific interventions to restore functioning and/or assist the parent in gaining requisite parenting skills if capacity to benefit has been determined. The evaluation should be guided by available best practice guidelines and any psychological tests utilized should be relevant to understanding parenting capacity, empirically supported and appropriate to the client's age, clinical status, and ethnicity. Unstructured clinical judgment or failure to address legal timelines will NOT meet quality review standards. Pursuant to Family Code 7827, "mentally disabled" as used in this section means that a parent or parents suffer a mental incapacity or disorder that renders the parent or parents unable to care for and control the child adequately. A proceeding may be brought where the child is one whose parent or parents are mentally disabled and are likely to remain so in the foreseeable future.
